### Measuring and Characterizing Network Time

### Introduction

- Frequency transport
  - One-way: forward & reverse packet streams can be used separately
  - Asymmetry is irrelevant
  - Stable frequency needed
  - PRC (primary reference clock) needed
  - GNSS/GPS antenna cable compensation/calibration not needed
  - GSM frequency backhaul (50 ppb) is example technology

- Time transport
  - Two-way: forward & reverse packet streams used together
  - Asymmetry is critical
  - Stable time and frequency needed
  - PRTC (primary reference time clock) or ePRTC (enhanced PRTC) needed
  - GNSS/GPS antenna cable compensation/calibration needed
  - LTE-TDD time/phase (1.5 µsec) is example technology

## Testing Time "Physical" vs. "Packet"

#### "1 PPS" (Single Point Measurement)

Measurements are made at a single point – a single piece of equipment in a single location - a phase detector with reference - is needed

#### "Packet" (Dual Point Measurement)

Measurements are constructed from packets time-stamped at two points - in • general two pieces of equipment, each with a reference, at two different locations – are needed

# Stability metrics for PDV

### Packet Selection Processes

- 1) Pre-processed: packet selection step prior to calculation
  - Example: *TDEV*(*PDVmin*) where *PDVmin* is a new sequence based on minimum searches on the original PDV sequence
- 2) Integrated: packet selection integrated into calculation
  - Example: *minTDEV*(PDV)

### Packet Selection Methods

- Minimum:
- Percentile:
- Band:
- Cluster:

$$\begin{aligned} x_{\min}(i) &= \min \left[ x_{j} \right] for(i \le j \le i + n - 1) \\ x'_{pct\_mean}(i) &= \frac{1}{m} \sum_{j=0_{b}}^{b} x'_{j+i} \\ x'_{band\_mean}(i) &= \frac{1}{m} \sum_{j=a}^{c} x'_{j+i} \\ x(n\tau_{0}) &= \frac{\sum_{i=0}^{(K-1)} w((nK+i)\tau_{p}) \cdot \phi(n,i)}{\sum_{i=0}^{(K-1)} \phi(n,i)} \qquad \phi(n,i) = \begin{cases} 1 & for \ |w(nK+i) - \alpha(n)| < \delta \\ 0 & otherwise \end{cases} \end{aligned}$$

# **Packet Selection Windows**

- Windows
  - Non-overlapping windows (next window starts at prior window stop)
  - Skip-overlapping windows (windows overlap but starting points skip over N samples)
  - **Overlapping windows** (windows slide sample by sample)

- Packet Selection Approaches (e.g. selecting fastest packets)
  - Select X% fastest packets (e.g. 2%)
  - Select N fastest packets (e.g. 10 fastest packets in a window)
  - Select all packets faster than Y (e.g. all packets faster than 150µs)

PDV metrics studying minimum floor delay packet population

# Time Transport: Two-way metrics

### **Packet Time Transport Metrics**

# Time Transport: Two-way packet delay

# Time Transport: Two-way metrics

#### Comments:

- Knowledge of asymmetry and latency in both directions is critical
- (2) 2wayTE is a fundamental twoway calculation
- (3) Ideal fwd/rev packet: floor Ideal 2wayTE: zero

## Two-way Time Error $\Leftrightarrow$ Network Asymmetry

#### Asymmetry in Wireless Backhaul (Ethernet wireless backhaul asymmetry and IEEE 1588 slave 1PPS under these asymmetrical network conditions)

### **Network Asymmetry**

### 150 km fiber PTP over OTN transport (2wayTE is 19.1 µsec which represents the 38.2 µsec difference between forward and reverse one-way latencies)

\sub Microsemi.

### Conclusions

- Packet time transport measurements require common time scale reference at both ends of the network being studied (GNSS at both ends is a way to do this)
- Asymmetry is everywhere, asymmetry is invisible to the IEEE 1588 protocol, thus asymmetry has a direct bearing on the ability to transport time precisely
- The "two-way time error" calculation is a direct measure of asymmetry
- There are two ways to assess time transport: (1) measuring a 1PPS reference at the node being studied and (2) measuring a packet signal at the node being studied
- Packet metrics for time transport must use both forward and reverse streams together rather than separately as is the case for frequency transport
- Packet metrics for time transport can make use of much of the methodology used for packet frequency transport metrics
